Problem of the Week-4: A Complicated Looking Limit
(that simplifies nicely using the definition of derivative and some algebraic tricks)

Let $g(x) = \ln(x)$. Evaluate the limit.

$$
\lim_{p \to 0} \left( \lim_{q \to 0} \left( \frac{g(27 + 27p + 9p^2 + p^3) - g(27)}{4pq} \right) - \frac{12 \cdot g(3 + p + q) - 12 \cdot g(3 + q)}{16pq} \right)
$$

Clearly show your steps
