

The design names below adhere to the naming conventions described in the following example.

In design PS_25_50,

PS = design was optimized using IMSPE for the PHYSICAL + SIMULATOR components

25_50 = (simulator, discrepancy) common correlation values used for the optimization were (0.25, 0.50)

The IMSPE values were calculated using the common correlation values that were used for the design optimization.

IMSPE values should only be compared across similar parameter values and numbers of inputs.

For example, the IMSPE values in the six red boxes can be compared.

The design construction times listed were the time needed to construct the design on a machine with a 3.5 GHz Quad-Core Intel Core i5 processor.

*The (40, 4, 50, 5) and (40, 4, 60, 6) designs were constructed using 16 cores of a single node on the Bluehive cluster at the Center for Integrated Research Computing at the University of Rochester. The authors thank the Center for Integrated Research Computing (CIRC) at the University of Rochester for providing computational resources and technical support.
